SUMMARY

Raschig Super-Pak® 250 (RSP 250) structured packing was tested at FRI's experimental distillation unit. The packing was tested in the 4-foot (1.22 m) section of the low-pressure column with the cyclohexane/n-heptane (C_6/C_7) system at 4.5 and 23.5 psia (0.31 and 1.62 bar) and the o/p xylene system at 1.43 psia (0.1 bar), or 75 mm Hg. The installation and portions of the tests were observed and approved by a Raschig GmbH representative.

INTRODUCTION

This test was originally conducted as FRI 2007 Category 3 Proprietary Test (proprietor-paid). The test was conducted under the Proprietary Device Test Procedure amended at the November, 2005, TAC meeting⁽¹⁾.

RSP 250 was tested for capacity, efficiency, and pressure drop using the C_6/C_7 system at 4.5 and 23.5 psia (0.31 and 1.62 bar), and the o/p xylene system at 1.43 psia (0.1 bar), or 75 mm Hg.

After the test, Raschig requested that the test be reclassified to a Category 2 test. The request was received within three months of the conclusion of operations and was approved by the Technical Committee.

DESCRIPTION OF EQUIPMENT

Packing --Raschig Super-Pak is a high-capacity vapor-liquid contacting device for use in distillation and other mass transfer columns. According to Raschig, the device is a hybrid of random/structured packing, with a highly open geometry, enhanced surfaces, and vertically-aligned packing sheets with regularly sequenced rows of sinusoidal waves above and below the plain of the metal sheet. The tested packing, shown in **Figure 1**, is segmented into six blocks in each layer for the 4-foot (1.22) diameter FRI column. The specific area and void fraction of RSP 250, provided by Raschig, were $77.7 \text{ ft}^2/\text{ft}^3$ ($255 \text{ m}^2/\text{m}^3$) and 0.98, respectively. Measurements by FRI on the packing that was received were $79.6 \text{ ft}^2/\text{ft}^3$ ($261 \text{ m}^2/\text{m}^3$) and 0.978. The nominal corrugation angle was 45° to the vertical, and the block height was 9.25 inches (235 mm). The packing used in the test was made of 304 stainless steel with a sheet thickness of 0.15 mm.

Liquid Distributors – Two DT-S liquid distributors, designed and supplied by Raschig, were used for this test. Each was a trough type distributor with a pre-distributor as shown in **Figure 2**. Both distributors were identical except for the sizes of the drip holes. There were total of 142 drip holes on each distributor, so the pour point density was 11.4 points/ ft^2 (123 points/ m^2), for the FRI column with its 4-foot (1.22 m) diameter. One distributor had a drip hole diameter of 4.8 mm, and was used with the operations with the C_6/C_7 system at 4.5 psia (0.31 bar) and with the o/p xylene system at 1.43 psia (0.1 bar). The second one had holes with diameters of 6.9 mm and was used with the operations with the C_6/C_7 system at 23.5 psia (1.62 bar). This latter distributor was also used with the C_6/C_7 system at 4.5 psia (0.31 bar) operations, without using liquid collector. All 142 drip holes were located 1-9/16 inches (40 mm) above the bottoms of the distributor troughs. Those 142 drip holes fed liquid into vertical tubes that were attached to the troughs. Those tubes are clearly shown in Figure 2. Ultimately, liquid issued vertically from the bottoms of the tubes. Both liquid distributors were water tested outside the column after the completion of test. The water test results, in terms of the ratios of standard deviation to the mean flow, are shown in **Figures 3-6**.

Figures 3 and **4** provide water test results for the distributor with 4.8 mm drip holes. **Figure 3** shows the ratio of the standard deviation to the mean flow, C_v , in terms of the liquid head from the

bottom of the trough. **Figure 4** is plotted vs. the total liquid rate flowing through the distributor. Except at very low heads, or low liquid rates, the distributor performed very well, with Cv's below 5 percent, as shown in **Figures 3** and **4**. Similar water test results were obtained for the distributor 6.9 mm drip holes as shown in **Figures 5** and **6**. Also included in those figures are the water test results independently obtained by Raschig before the distributors were shipped to FRI. Raschig's results are very close to the FRI water test data.

Support Plate - The packing support plate for the tests was supplied by Raschig. It was a grid type structured packing support plate.

Samplers – No in-bed sampler was used for this test. The below-bed sampler used for this test was FRI center-draw cross sampler. A description of the sampler and other details are given in Topical Report 129⁽²⁾.

Liquid Collector/Vapor Distributor -- The vapor distributor/liquid collector used in the tests was designed and manufactured by Raschig. It consisted of ten high rectangular risers. Each riser was fitted with an angled cap. The vapor distributor/liquid collector was fitted with two 8 inch (203 mm) downpipes. The liquid collector/vapor distributor was only used for the first phase of the test.

Gamma Ray Scanning Equipment - The gamma ray scanning equipment was the same as that described in the Topical Report 166⁽³⁾.

Confidential Information Withheld by Proprietor - Consistent with the past practice of many Proprietors, certain information regarding these structured packing tests was regarded by the Proprietor as "trade secrets" and is not included in this Report. FRI's listing of the excluded information is consistent with the verbiage of the Procedure for Conducting, Interpreting and Reporting Tests of Proprietary Contacting Devices, which was approved by the TAC on May 28, 2009. The list of excluded information follows:

Details regarding the "enhanced surfaces", i.e., the texturing
Details regarding the "sinusoidal waves", e.g., their locations, widths and depths
Details regarding the designs and linkages of the distributor troughs
Details regarding the support plates
Details regarding the liquid collector/vapor distributor

An appreciable amount of information was provided by Raschig to FRI for this Topical Report.

INSTALLATION OF EQUIPMENT

Test with Liquid Collector/Vapor Distributor

The first phase of the program was conducted using the liquid collector/vapor distributor installed below the packing support plate. **Figure 7** is a sketch of the column configuration used for the first phase, locating the liquid collector/vapor distributor, packing support plate, samplers, packed bed, thermowells, taps for pressure drops, liquid distributor, and other equipment. The deck of the vapor distributor/liquid collector was located 112 inches (2.84 m) above the column head-seam. The two downpipes fitted with the collector were positioned at the north and south side of the column. To maximize the range of the gamma scanning and avoid the slightly out-of-roundness column section, the packing support plate was installed 149 inches (3.78 m) above column headseam. A cross sampler was installed below the packing support plate to withdraw samples of liquid exiting the bottom of the packed

bed. A thermowell was attached to the center of the cross sampler to measure the liquid temperature. Inside the packed bed, a thermowell was installed at interface of between layers 6 and 7; another one between layers 14 and 15. No mid-bed sampler was installed for this test. The bottom layer of packing was installed with the seams perpendicular to the beams of the support plate. Each layer of structured packing was rotated 90° from the previous layer. Fifteen layers of RSP 250 structured packing were installed to a total bed depth of 11.6 ft (3.53 m). The hold down device was a high open area steel grid placed on the top of the bed and held in place by bolting to the liquid distributor. Wall wipers were installed between the 4-foot (1.22) column section and the conical transition section to collect and guide vapor condensation to the distributor troughs. The bottom of the distributor trough was placed 4-1/3 inches (110 mm) above the top of the packed bed. The distributor was suspended with four adjustable rods secured to brackets, carefully centered and leveled with water. The liquid composition of the distributor was obtained with a brass tapping inserted in the pan floor and 3/8 inch (9.5 mm) copper withdrawal tubing. The distributor liquid temperature was measured using a thermowell located near the bottom of the distributor.

Packing pressure drop was measured with three differential pressure transmitters. One was for the bottom half of the bed (0-68 inches; (0-1.73 m)), the second one for the top half of the bed (68-138.8 inches; (1.73-3.53 m)), and the third for the overall bed (0-138.8 inches; (0-3.53 m)). All distances are measured from the bottom of the support plate. Pressure drops were also measured across the liquid collector/vapor distributor and the liquid distributor. A bubbler connected to a pressure transmitter was installed inside the liquid distributor to measure liquid heads. Each pressure transmitter had its own independent leg and column connection. The legs were continuously purged with a constant flow of nitrogen. Installation of the equipment was witnessed and approved by a representative of Raschig. After finishing the test, the packing and other equipment were removed from the column and inspected. The packing did not appear to have any damage and no anomalies were found for all of the equipment.

Tests Without Liquid Collector/Vapor Distributor

After finishing testing with the liquid collector/vapor distributor, the packed bed was leftunchanged, and the liquid collector/vapor distributor was removed from the column via the bottom manway. During the removal process, everything above the liquid collector/vapor distributor was not disturbed. Some conditions at medium to high rates were repeated.

Gamma Ray - The calibration and operation were the same as those described in Topical Report 166⁽³⁾. Two vertical elevations were scanned. One was at the middle of layer 6, another was at the interface of layers 5 and 6. For each vertical position, the packed bed was scanned at three different horizontal locations, those being centerline and 10 and then 20 inches (254 and 508 mm) off the centerline.

EXPERIMENTAL PROCEDURE

A process flow diagram of the FRI low-pressure distillation column as configured for this test is shown in **Figure 8**.

FRI's standard operating procedure is to establish the flood point, decrease the operating loads to about 20 per cent of the flood point to unload the bed, and then run a total reflux efficiency series. A procedure similar to this was followed for most of the data taken unless it is mentioned otherwise. All run conditions were total reflux with efficiency, capacity, and pressure drop measurements.

Test sequences were as follows:

I. Test with liquid collector/vapor distributor:

1. Operation with the o/p xylene system at 1.43 psia (0.1 bar), or 75 mmHg, using DT-S with 4.8 mm drip holes
2. Operation with the C₆/C₇ system at 4.5 psia (0.31 bar) using the 4.8 mm drip hole distributor
3. Liquid distributor change-over (changed to distributor with 6.9 mm drip holes)
4. Operation with the C₆/C₇ system at 23.5 psia (1.62 bar) using the 6.9 mm drip hole distributor

II. Test without liquid collector/vapor distributor:

1. Removal of the liquid collector via the column bottom manway
2. Operation with the C₆/C₇ system at 23.5 psia (1.62 bar) using the 6.9 mm drip hole distributor
3. Operation with the C₆/C₇ system at 4.5 psia (0.31 bar) using the 6.9 mm drip hole distributor
4. Liquid distributor change-over (changed to distributor with 4.8 mm drip-holes)
5. Operation with the o/p xylene system at 1.43 psia (0.1 bar), or 75 mmHg, using DT-S 4.8 mm drip hole distributor

RESULTS

Summary of the Test Results

Experimental results for the RSP 250 structured packing are summarized in **Tables I to V**. **Tables I to III** provide test results with the liquid collector/vapor distributor. **Tables IV and V** provide the data collected without the liquid collector/vapor distributor in service.

A summary of run conditions for all test systems follows:

<u>Run No.</u>	<u>System</u>	<u>Pressure psia (bar)</u>	<u>Table No.</u>	<u>Run Type</u>	<u>Liquid Collector</u>
23598-23611 &23616-23621	o/p xylene	1.43 (0.1)	I	Total Reflux	Yes
23622-23623 &23628-23637 &23640-23647	C ₆ /C ₇	4.5 (0.31)	II	Total Reflux	Yes
23648-23673	C ₆ /C ₇	23.5 (1.62)	III	Total Reflux	Yes
23674-23687	C ₆ /C ₇	23.5 (1.62)	IV	Total Reflux	No
23688-23700 &23703-23707	C ₆ /C ₇	4.5 (0.31)	V	Total Reflux	No

In **Tables I to V**, the liquid hold up in the packed bed was measured at the column centerline. Gamma scan results at other locations are available to the membership upon request.

Notes on the Results

During the RSP 250 testing, for all total reflux runs prior to flood conditions, the below-bed C₆ compositions were adjusted so that the mid-bed C₆ compositions were around 50%, unless specified otherwise. Capacity factors, Cs, are based on physical properties at the bottom of the packed bed, mid-bed, and top of the bed.

NOMENCLATURE

C_6	cyclo-hexane
C_7	normal-heptane
C_s	Capacity factor, $u_s (\rho_v / (\rho_L - \rho_v))^{0.5}$, ft/s (m/s)
F_s	Superficial F Factor, $u_s (\rho_v)^{0.5}$, ft/s(lb/ft ³) ^{0.5} (m/s(kg/m ³) ^{0.5})
HETP	Height equivalent to a theoretical plate, inches (mm)
o/p	ortho/para
u_s	Superficial vapor velocity based on column cross sectional area 12.44 ft ² (1.16 m ²), ft/s (m/s)
ρ_L	Liquid density, lb/ft ³ (kg/m ³)
ρ_v	Vapor density, lb/ft ³ (kg/m ³)
